## ANIMALBEHAVIOR SCRIPT GUIDE

=====

====

### OVERVIEW:

The AnimalBehavior script enables a mob to move naturally and randomly within a designated area.

In short, the mob will choose and move toward a random direction at specific time intervals, ensuring it never leaves its predefined boundaries.

### ATTRIBUTES:

#### \* Speed

Defines how fast the mob moves.

#### \* WalkDelay

The duration (in seconds) the mob stays idle before moving again.

#### \* WalkDuration

The duration (in seconds) the mob continuously walks before stopping.

#### \* WalkAreaSize

The size of the movement area. The mob will strictly stay within these boundaries.

\* SpriteInRight

Enable this option if your original character sprite naturally faces right.

NOTES & RECOMMENDATIONS:

- ANIMATIONS: If your mob has animations, ensure the Animator controller includes the following parameters: "Walk" and "Rest".
- SETUP GUIDE: We highly recommend reviewing the pre-configured Prefabs to replicate the exact Animator state machine setup for flawless integration.
